A: You are using the classical way of deriving the input layer weights and biases. `input_layer_weights = np.random.randn(input_layer_size, num_of_input_features)` `input_layer_biases = np.random.randn(input_layer_size)` What you need to do is: `input_layer_biases = np.zeros(input_layer_size)` This line of code does not make any sense. `input_layer_size` is supposed to be the number of neurons in the input layer, and you are setting the biases to zero. Since the bias for every neuron is always zero, you should set them all to zero and remove that line of code. However, I am still wondering how the `-1*input_layer_size` comes in the equation above. The classical way of deriving the weights and biases for the input layer is explained in this article, and the link also contains links to different neural network libraries (in python). The E.P.A. has not yet put final rules in place to implement the Clean Power Plan. But it's been busy, first dropping two lawsuits challenging the power plant emissions rules and last month releasing final rules to define the greenhouse gas emissions and carbon dioxide pollution that power plants are required to limit. As of this week, it will no longer be possible to use the gasoline blendstock most commonly used in the United States to make gasoline. The agency has also begun the process of expanding the nation's oil pipeline network. The basic outline of the Clean Power Plan, as it is now, is a series of deadlines that will require every state to reduce its total annual emissions of carbon dioxide and other greenhouse gases from 2012 levels by a certain percentage by the year 2030. This requires a significant effort on the part of states because the rules don't dictate specific emission cuts, which should be a matter for state legislators and governors to decide. State officials will work with a handful of coal-burning power plants — the two most important are the Mississippi River power stations in St. Louis and La Crosse, Wis., and the so-called Dirty Thirty power plants in Kentucky, Ohio, Indiana and West Virginia — to prepare a plan that 82157476af
